Fundamental Concepts in Engineering Economy According to Thuesen and Fabrycky

Time Value of Money

A cornerstone of engineering economy, the concept recognizes that money has a different value over time. Thuesen and Fabrycky delve into:

- Present Worth (PW): Discounting future cash flows to their present value.
- Future Worth (FW): Compounding present values to a future date.
- Equivalent Uniform Annual Cost (EUAC): Converting irregular cash flows into a series of equal annual values for comparison.

Key formulas include:

- Present Worth: $PW = F \times \frac{1}{(1 + i)^n}$
- Future Worth: $FW = P \times (1 + i)^n$
- Annuity factors for simplifying calculations.

Cost Classifications and Behavior

Understanding different costs is vital for accurate economic analysis:

- Fixed Costs: Do not change with activity level.
- Variable Costs: Vary directly with production volume.
- Semi-variable Costs: Contain both fixed and variable components.

- Incremental Costs: Additional costs incurred by choosing one alternative over another.

Thuesen and Fabrycky emphasize the importance of distinguishing these costs to predict future expenses accurately.

Cash Flow Analysis

The book stresses the importance of analyzing all cash inflows and outflows associated with a project. It advocates for:

- Developing detailed cash flow diagrams.
- Using discounted cash flow methods to account for the time value of money.
- Recognizing the significance of initial investments, operating costs, and salvage values.

Decision-Making Techniques in Engineering Economy

Comparison of Alternatives

Selecting the best project or option requires systematic comparison methods:

- Net Present Value (NPV): Sum of discounted cash flows; positive NPV indicates a profitable project.
- Benefit-Cost Ratio (BCR): Ratio of present benefits to present costs; values greater than 1 are favorable.
- Internal Rate of Return (IRR): Discount rate that makes NPV zero; higher IRR suggests better investment.
- Modified Internal Rate of Return (MIRR): Adjusts IRR for reinvestment assumptions.

Thuesen and Fabrycky highlight the importance of understanding the assumptions behind each method and choosing the most appropriate one based on context.

Payback Period and Profitability Index

Additional tools include:

- Payback Period: Time required to recover the initial investment.
- Profitability Index (PI): Present value of benefits divided by the present value of costs; useful for ranking projects when capital is limited.
