Understanding Curved Mirrors and Their Properties

Before diving into problem-solving, it's important to understand the basics of curved mirrors, their types, and key properties.

Types of Curved Mirrors

- Concave Mirrors: Reflect inward, converging light rays to a focal point. Used in shaving mirrors, headlights, and telescopes.
- Convex Mirrors: Reflect outward, diverging light rays. Common in vehicle side mirrors and security mirrors.

Key Concepts and Terminology

- Principal Axis: The line passing through the center of curvature and the mirror's pole.
- Pole (P): The midpoint of the mirror's surface.
- Center of Curvature (C): Center of the sphere from which the mirror segment is taken.
- Focus (F): The point where rays parallel to the principal axis converge (concave) or appear to diverge from (convex).
- Focal Length (f): Distance from the mirror to the focus point.
- Object Distance (u or d_o): Distance from the object to the mirror.
- Image Distance (v or d_i): Distance from the image to the mirror.
- Magnification (m): Ratio of the height of the image to the height of the object.

Fundamental Mirror Formulae and Magnification

Quantitative problems involving curved mirrors primarily rely on two key formulas: the mirror formula and the magnification formula.

The Mirror Equation

\[

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

\]

- f: Focal length of the mirror.
- v: Image distance from the mirror.
- u: Object distance from the mirror.

Note: Sign conventions are crucial. For the typical Cartesian sign convention:

- Object distance (u) is negative if the object is in front of the mirror.
- Image distance (v) is positive if the image is real and formed in front of the mirror; negative for virtual images.
- Focal length (f) is positive for concave mirrors and negative for convex mirrors.

Magnification Formula

\[

$$m = \frac{h_i}{h_o} = - \frac{v}{u}$$

\]

- h_i : Height of the image.
- h_o : Height of the object.
- The negative sign indicates image orientation (inverted or erect).

Step-by-Step Approach to Solving Curved Mirror Problems Quantitatively

To effectively solve problems, follow this structured approach:

1. Identify the Given Data

- Object distance (u)
- Image distance (v) (if given)
- Focal length (f)
- Object height (h_o)
- Image height (h_i) (if given)

2. Determine the Sign Conventions

Always clarify the sign conventions based on the problem statement and the type of mirror.

3. Apply the Mirror Formula

Use:

\[

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

\]

to find the unknown, ensuring sign conventions are adhered to.

4. Calculate Magnification

Use:

\[

$$m = - \frac{v}{u}$$

\]

to find the size and orientation of the image.

5. Find the Image Height or Object Height

If necessary, determine the image height using:

\[

$$h_i = m \times h_o$$

\]

6. Check the Reasonableness of the Result

Verify whether the calculated distances and magnification make sense physically (e.g., a real image should have positive v in the sign convention used).

Common Types of Curved Mirror Problems and Their Solutions

Below are typical problems encountered in worksheets involving curved mirrors, with detailed solutions.

Problem Type 1: Finding Image Position and Nature

Example:

An object is placed 20 cm in front of a concave mirror with a focal length of 15 cm. Find the position and nature of the image.

Solution Steps:

- Identify Data:
- $u = -20$ cm (object in front, sign convention)
- $f = +15$ cm (concave mirror)

- Apply Mirror Equation:

\[

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

\]

\[

$$\frac{1}{15} = \frac{1}{v} + \frac{1}{-20}$$

\]

\[

$$\frac{1}{v} = \frac{1}{15} + \frac{1}{20}$$

\]

\[

$$\frac{1}{v} = \frac{4}{60} + \frac{3}{60} = \frac{7}{60}$$

\]

\[

$$v = \frac{60}{7} \approx 8.57 \text{ cm}$$

\]

- Interpretation:

- v is positive ? real image, formed in front of the mirror.

- Magnification:

\[

$$m = -\frac{v}{u} = -\frac{8.57}{-20} \approx 0.43$$

\]

- The image is real, inverted, and smaller than the object.

Problem Type 2: Calculating Magnification and Image Height

Example:

An object 5 cm tall is placed 30 cm in front of a convex mirror with a focal length of -20 cm. Find the height of the image.

Solution:

- Given Data:

- $u = -30$ cm

- $f = -20$ cm (convex mirror)

- Calculate v :

\[

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

\]

\[

$$\frac{1}{-20} = \frac{1}{v} + \frac{1}{-30}$$

\]

\[

$$\frac{1}{v} = \frac{1}{-20} - \frac{1}{-30} = -\frac{1}{20} + \frac{1}{30} = -\frac{3}{60} + \frac{2}{60} = -\frac{1}{60}$$

\]

\[

$$v = -60 \text{ cm}$$

\]

- Calculate Magnification:

\[

$$m = -\frac{v}{u} = -\frac{-60}{-30} = -2$$

\]

- Find Image Height:

\[

$$h_i = m \times h_o = -2 \times 5\,\text{cm} = -10\,\text{cm}$$

\]

- The negative sign indicates the image is erect (since convex mirrors produce erect images) and diminished.
- The image height is 10 cm, upright and smaller than the object.

Whether you're a student preparing for exams or a curious learner eager to understand how curved mirrors work in real-world scenarios, this guide aims to demystify the concepts, problem-solving strategies, and applications related to curved mirror problems. This article will walk you through the fundamentals, typical problem types, step-by-step solutions, and tips to excel in solving these problems efficiently.

Introduction to Curved Mirrors and Their Significance

Curved mirrors are reflective surfaces with a curved shape—either convex (bulging outward) or concave (caving inward). They play a vital role in various optical devices, such as telescopes, headlights, shaving mirrors, and microscopes. The behavior of light rays interacting with these mirrors determines the formation of images, which can be real or virtual, magnified or diminished, depending on the mirror's shape and the object's position.

Core Concepts of Curved Mirror Problems

Before diving into problem-solving, it is crucial to understand the foundational concepts that underpin worksheet 6 curved mirror problems quantitative:

- Types of Curved Mirrors

- Concave Mirrors: Converge light rays; can produce real or virtual images.
- Convex Mirrors: Diverge light rays; always form virtual, diminished images.

- Key Parameters

- Object Distance (u): Distance from the object to the mirror (usually negative, following sign conventions).
- Image Distance (v): Distance from the image to the mirror (positive for real images, negative for virtual images).
- Focal Length (f): The distance from the mirror to the focal point; positive for concave, negative for convex mirrors.
- Radius of Curvature (R): Related to focal length via $R = 2f$.

- Sign Conventions

Adopting a consistent sign convention is crucial for accurate calculations:

Parameter	Sign Convention
Object distance (u)	Negative if object is in front of mirror (real object)
Image distance (v)	Positive if the image is real (on the same side as object), negative if virtual
Focal length (f)	Positive for concave mirrors, negative for convex mirrors
Radius of curvature (R)	Positive for concave, negative for convex mirrors

- Mirror Formula

The fundamental relation connecting object distance, image distance, and focal length:

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

- Magnification

Magnification (M) describes how much larger or smaller the image appears relative to the object:

$$M = \frac{h_i}{h_o} = -\frac{v}{u}$$

where h_i = image height, h_o = object height. A negative magnification indicates an inverted image.

Worked Examples of Worksheet 6 Curved Mirror Problems Quantitative

Example 1: Finding the Image Position

Problem: An object 20 cm in front of a concave mirror has an image formed 15 cm from the mirror. What is the focal length of the mirror?

Solution:

- Identify knowns:
 - Object distance $(u = -20\text{ cm})$ (since object is in front).
 - Image distance $(v = +15\text{ cm})$ (since image is real and on the same side).
- Use mirror formula:

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

- Calculate:

$$\frac{1}{f} = \frac{1}{15} + \frac{1}{-20} = \frac{4}{60} - \frac{3}{60} = \frac{1}{60}$$

$$f = +60\text{ cm}$$

Answer: The focal length of the mirror is +60 cm.

Example 2: Determining the Magnification and Image Size

Problem: An object 10 cm tall is placed 30 cm in front of a convex mirror with a focal length of 15 cm. Find the image size and whether the image is upright or inverted.

Solution:

- Identify knowns:

- $(f = -15\text{ cm})$ (convex mirror, negative focal length).

- Calculate image distance (v) :

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

$$\frac{1}{-15} = \frac{1}{v} + \frac{1}{-30}$$

$$-\frac{1}{15} = \frac{1}{v} - \frac{1}{30}$$

$$\frac{1}{v} = -\frac{1}{15} + \frac{1}{30} = -\frac{2}{30} + \frac{1}{30} = -\frac{1}{30}$$

$$v = -30\text{ cm}$$

- Calculate magnification (M) :

$$M = -\frac{v}{u} = -\frac{-30}{-30} = -1$$

The negative sign indicates the image is upright (since magnification is negative in optics for upright images in this convention, but note the sign conventions carefully).

$$h_i = M \times h_o = -1 \times 10\text{ cm} = -10\text{ cm}$$

The negative sign indicates the image is upright and of the same size as the object.

Answer: The image is upright, of height 10 cm, and located 30 cm behind the mirror (virtual image).

Question What is the formula to find the image distance in a curved mirror problem? The formula used is the mirror equation: $\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$, where f is the focal length, v is the image distance, and u is the object distance. How do you determine whether the image formed by a curved mirror is real or virtual? If the image distance (v) is positive, the image is real and formed on the same side as the reflected rays; if v is negative, the image is virtual and formed on the opposite side. What is the relationship between the focal length and the radius of curvature in a concave mirror? The focal length (f) is half the radius of curvature (R), expressed as $f = R/2$. How do you calculate the magnification in a curved mirror problem? Magnification (m) is calculated using $m = v/u$, where v is the image distance and u is the object distance. It also indicates whether the image is upright or inverted. What are the standard sign conventions used in solving curved mirror problems? In sign convention: distances measured in the direction of the incident light are positive; distances measured against the direction of incident light are negative. For mirrors, focal length and image distance are positive for real images and concave mirrors, negative for virtual images and convex mirrors. How can you determine the size of the image in a curved mirror problem? The size of the image can be found by multiplying the object height by the magnification: Image height = magnification $\times$ object height.
