QuestionAnswer What is the Pythagorean theorem and how is it used in seventh grade mathematics? The Pythagorean theorem states that in a right-angled triangle, the square of the hypotenuse (longest side) is equal to the sum of the squares of the other two sides: $a^2 + b^2 = c^2$. It is used to find the length of a side or verify if a triangle is right-angled. How do you simplify algebraic expressions in seventh grade? Simplifying algebraic expressions involves combining like terms (terms with the same variables and exponents) and applying the distributive property to expand or factor expressions as needed. What are the properties of integers that seventh graders should understand? Seventh graders should understand properties like the commutative, associative, and distributive properties of addition and multiplication, as well as the concept of additive and multiplicative inverses. How do you solve one-step and two-step equations? To solve one-step equations, perform inverse operations to isolate the variable (e.g., add, subtract, multiply, or divide both sides). For two-step equations, perform the inverse operations in reverse order to isolate the variable. What is the difference between mean, median, and mode? Mean is the average of a set of numbers, median is the middle value when the numbers are sorted, and mode is the number that appears most frequently in the set. How do you find the volume of a rectangular prism? The volume of a rectangular prism is found by multiplying its length, width, and height: $\text{Volume} = \text{length} \times \text{width} \times \text{height}$. What is the coordinate plane and how do you plot points on it? The coordinate plane is a two-dimensional surface formed by two perpendicular axes: the x-axis (horizontal) and y-axis (vertical). To plot a point, locate its x-coordinate along the x-axis and its y-coordinate along the y-axis, then mark the point at the intersection. How do you convert between fractions, decimals, and percentages? To convert a fraction to a decimal, divide the numerator by the denominator. To convert a decimal to a percentage, multiply by 100. To convert a percentage to a decimal, divide by 100, and to a decimal to a fraction, write it as a fraction and simplify. What are proportional relationships and how are they identified? Proportional relationships occur when two quantities increase or decrease at the same rate, and their ratios are equal. They can be identified by checking if the ratios of corresponding values are constant or by using equations of the form $y = kx$. How do you solve problems involving percentages and discounts? To find a percentage of a number, multiply the number by the percentage (as a decimal). To calculate discounts, subtract the discount amount (original price $\times$ discount rate) from the original price.
